Latvia

Monitoring and surveillance
Overweight and obesity in three age groups

**Adults (15/20 years and over)**

Intercountry comparable overweight and obesity estimates from 2008 (1) show that 57.5% of the adult population (≥20 years old) in Latvia were overweight and 24.9% were obese. The prevalence of overweight was higher among men (60.7%) than women (55.0%). The proportion of men and women that were obese was 22.4% and 27.0%, respectively.

According to the FINBALT 2008 survey (of the nationally representative population aged 15–64 years), 48.5% were overweight and 18.5% were obese. Overweight prevalence estimates for men and women were 51.1% and 46.7%, respectively (2). The prevalence of obesity for men and women was 16.2% and 20.2%.

---

**Notes:**

The country codes refer to the ISO 3166-1 Alpha-3 country codes. Data ranking for obesity is intentionally the same as for the overweight data. BMI: body mass index.

respectively. It should be taken into account that these data do not allow for comparability across countries due to sampling and methodological differences.

Adulthood obesity prevalence forecasts (2010–2030) predict that in 2020, 12% of men and 21% of women will be obese. By 2030, the model predicts that 14% of men and 20% of women will be obese.1

Adolescents (10–19 years)
In terms of prevalence of overweight and obesity in adolescents, up to 13% of boys and 8% of girls among 11-year-olds were overweight, according to data from the Health Behaviour in School-aged Children (HBSC) survey (2009/2010).2
Among 13-year-olds, the corresponding figures were 14% for boys and 9% for girls, and among 15-year-olds, 13% and 7%, respectively (3).

Children (0–9 years)
Estimates from the first round (2007/2008) of the WHO European Childhood Obesity Surveillance Initiative (COSI) show that among 7-year-olds in Latvia, 24.0% of boys and 18.9% of girls were overweight and 8.6% and 4.6%, respectively, were obese (4).2

Exclusive breastfeeding until 6 months of age
Nationally representative data from 2011 show that the prevalence of exclusive breastfeeding at 6 months of age was 16.4% in Latvia.3

Saturated fat intake
According to 2007 estimates, the adult population in Latvia consumed 12.0% of their total calorie intake from saturated fatty acids (5).

Fruit and vegetable supply
Latvia had a fruit and vegetable supply of 414 grams per capita per day, according to 2009 estimates (5).

Salt intake
Data from 2007–2009 show that salt intake in Latvia was 7.1 grams per day for both men and women (6).

Iodine status
According to the most recent estimates on iodine status, published in 2012, the proportion of the population with an iodine level lower than 100 µg/L was 76.8% (7, 8).

Physical inactivity
In Latvia, 33.2% of the population aged 15 years and over were insufficiently active (men 29.2% and women 36.5%), according to estimates generated for 2008 by WHO (1).

Policies and actions
The table below displays (a) monitoring and evaluation methods of salt intake in Latvia; (b) the stakeholder approach toward salt reduction; and (c) the population approach in terms of labelling and consumer awareness initiatives (6).

Marketing of food and non-alcoholic beverages to children (10)

In 2006, regulations were adopted with the aim of restricting and controlling the marketing of foods and beverages of limited nutritional value in preschool institutions and schools (11, 12). Otherwise restrictions are based on self-regulation.
