Cost-effectiveness evidence – a case study

This document is intended to support immunization programme managers and staff in their efforts to secure sustainable funding for immunization.

**HOW TO USE THIS DOCUMENT**

It is important that decision-makers and partners appreciate the importance of immunization, not just as a public health intervention but as a national investment that yields socioeconomic returns and health care savings.

This document presents summaries and key findings from a cost-effectiveness study. It is one of ten such studies drawn from evidence published in peer-reviewed journals and official documentation. The summaries can be drawn upon to support your country’s efforts to raise the profile of immunization and ensure continued investment in it within the context of health care prioritization.

**Use the summaries as inspiration, to prepare for a meeting or to hand out to stakeholders.**

The case studies will help most when they are used to help paint a national picture and a strong country-specific case for continued support in immunization. Present the studies alongside descriptions of the national issues and challenges. If available, supplement them with your own national data. If the same data is not available, consider using other national data that can serve as a proxy.
Evidence for strengthening an existing vaccine programme

Case study: Germany – measles

**KEY FINDINGS**

A study of the costs of a measles outbreak in a region of Germany was conducted. Parental reasons in the case of non-vaccinated children were also explored. The key findings included the following.

- An accumulation of non-immune individuals led to an outbreak of 1749 cases in North Rhine-Westphalia in 2006.
- Targeted efforts such as school-based catch-up campaigns for older age groups are needed to close immunity gaps to prevent outbreaks.
- Most cases occurred in the city of Duisburg (614 cases), where
  - at least 80% of cases were reported as having received no vaccinations;
  - almost 3000 school days and about 300 work days were missed by patients with measles;
  - 95 patients were hospitalized for a total of 775 days;
  - each measles case cost about €520 (including the cost to the local public health office).

**Methods**

A school-based retrospective cohort study was conducted during the initial phase of the 2006 measles outbreak in North Rhine-Westphalia (NRW).

Overall coverage with two-dose measles-containing vaccine (MCV) in 2005 in NRW was 74.7%.

All cases notified in the worst-affected city, Duisburg, were invited to participate by interview or questionnaire. 81% of 614 cases in Duisburg were interviewed. The median age of interviewed measles cases was 11 years.

**About measles**

The measles virus is highly infectious. Measles can lead to serious complications such as death, blindness, encephalitis, pneumonia and severe diarrhoea.

Measles incidence increased by 348% in the WHO European Region between 2007 and 2013 due to immunity gaps.

---

Results

Coverage

- 94% were unvaccinated or had only received one dose of MCV.
- Among the key reasons for under-vaccination were that parents had forgotten, they rejected vaccination, or a doctor had advised against vaccination.

Health

- Complications reported:
  - 19% otitis media
  - 7% pneumonia
  - 0.6% encephalitis
  - 2 deaths.

Economy

- Measles patients missed 2,854 school days and 301 work days
- Healthcare provider costs for the 614 measles patients in Duisburg were estimated at € 229,000.

Table 1. Reasons for non-vaccination (reported by parents of measles patients in the Duisburg 2006 outbreak)

Table 2. Health care costs, Duisburg measles outbreak 2006

- Total costs for hospitalization € 178,329
- Outpatient consultations € 27,528
- Laboratory tests € 20,826
- Antibiotic treatment € 2,440
- Total € 229,123
