Monitoring and surveillance
Overweight and obesity in three age groups

Adults (20 years and over)

Intercountry comparable overweight and obesity estimates from 2008 (1) show that 50% of the adult population (> 20 years old) in the Republic of Moldova were overweight and 21.2% were obese. The prevalence of overweight was lower among men (38.4%) than women (60.1%). The proportion of men and women that were obese was 9.9% and 31.0%, respectively. Adulthood obesity prevalence forecasts (2010–2030) predict that in 2020, 18% of men and 32% of women will be obese. By 2030, the model predicts that 25% of men and 35% of women will be obese.1

1 Report on modelling adulthood obesity across the WHO European Region, prepared by consultants (led by T. Marsh and colleagues) for the WHO Regional Office for Europe in 2013.

The Regional Office is grateful to the European Commission (EC) for its financial support for the development of the nutrition, obesity and physical activity database that provided data for this country profile.
Adolescents (10–19 years)
No data are available from the Health Behaviour in School-aged Children (HBSC) survey (2009/2010). However, according to data from the Moldova Demographic and Health Survey (DHS) 2005, the prevalence of overweight and obesity among girls aged 15–19 years was 8.2% and 0.9%, respectively (2). Similar data for boys were not available. These data should be interpreted with caution as WHO criteria for adults were used to define overweight/obesity indicators in adolescents aged 15–19 years.

Children (0–9 years)
No data are available from the WHO European Childhood Obesity Surveillance Initiative (COSI) 2007/2008 round. The Republic of Moldova, however, joined the third COSI data collection round during the school year 2012/2013.

Exclusive breastfeeding until 6 months of age
Nationally representative data from 2005 show that the prevalence of exclusive breastfeeding under 6 months of age was 45.5% in the Republic of Moldova (2).

Saturated fat intake
No data are available.

Notes.
The country codes refer to the ISO 3166-1 Alpha-3 country codes. Ranking of data was carried out so that country data at the right-hand side of the graph – with values below the FAO recommendation – fall within the positive frame of the indicator. FAO: Food and Agriculture Organization of the United Nations.

Fruit and vegetable supply
The Republic of Moldova had a fruit and vegetable supply of 431 grams per capita per day, according to 2009 estimates (3).

Salt intake
No data are available.

Iodine status
According to the most recent estimates on iodine status, published in 2012, the proportion of the population with an iodine level lower than 100 µg/L was 27.0% (5, 6).

Physical inactivity
No WHO Global Health Observatory Data Repository estimates are available from 2008. However, national data from 2005 show that 59.2% of the adult population were physically inactive during their leisure time (7). It should be taken into account that this figure does not allow for comparability across countries.

Policies and actions
The table below displays (a) monitoring and evaluation methods of salt intake in the Republic of Moldova; (b) the stakeholder approach toward salt reduction; and (c) the population approach in terms of labelling and consumer awareness initiatives (4).

### Marketing of food and non-alcoholic beverages to children (8)

Law 10 on the State Surveillance of Public Health of 2009 (article 38) stipulates that reducing the marketing pressure – especially on children – to consume energy-dense food is an action point for controlling the obesity epidemic (9). Ministry of Health Decision No. 13 of 31 July 2007 forbids the marketing of energy-dense food with a high fat content and reduced nutritional value in institutions for children (such as soft drinks, with or without food additives; chips and similar products; pastry products with cream; chewing gum; toffees; and “quick-cook” pasta) (10). Law No. 78 on Food of 2004 (11) (amended in 2012) (12) defines “food not recommended for preschool and school children (0–18 years old)” as “food with high content of fats, sugar and salt” and prohibits their preparation, sale and distribution in schools and preschools and within 100 m of these institutions. Order of the Ministry of Health No. 904 of 17 September 2012 (issued under the Food Law) establishes a list of food not recommended for school and preschool children (13). This list includes criteria for defining foods high in salt, fats, sugars and energy, including soft drinks and foods containing trans fat.

### Physical activity (PA), national policy documents and action plans
