IMPROVING MEN’S HEALTH IN IRELAND: 
Building capacity among front-line health workers to engage men
Noel Richardson¹, Isabel Yordi Aguirre²

Summary

Noncommunicable diseases are the leading cause of death and disability among men in Ireland and are underpinned by men’s poorer lifestyle behaviours and underutilization of health services. Ireland’s National Men’s Health Policy (2008–2013) identified building capacity among front-line service providers as an essential but neglected component of developing effective strategies for engaging men in self-care. In order to tackle this deficit in gender sensitive service provision for men, ENGAGE, Ireland’s National Men’s Health Training programme, was developed. The comprehensive one-day training is based on an experiential learning and reflective practice approach, combined with mechanisms for feedback and peer support during and beyond training. ENGAGE has improved service providers’ knowledge, skills and capacity to engage and work with men and to deliver more gender-competent health services and programmes; boosted community outreach programmes to priority groups of men; and influenced the development of gender sensitive service provision.

Towards gender sensitive service provision for men

In Ireland, as in most European countries, men’s lower life expectancy is underpinned by higher death rates from noncommunicable diseases, the leading cause of death and disability among men. Substantive differences in health outcomes are also evident between different categories of men. For example, men from lower socioeconomic groups experience significantly higher mortality rates than men from higher socioeconomic groups, and this gap between rich and poorer men has been increasing. Other subpopulations, such as male travellers, gay, bisexual and transgender men, and farmers experience health outcomes that are significantly worse than the general population of Irish men. It has also been well documented that men who experience social disadvantage, marginalization and social exclusion experience a disproportionate burden of ill health.

In addition to broader social determinants of health, engaging with the health system and self-management can lead to better noncommunicable

Key Messages

• Noncommunicable diseases remain the leading cause of death and disability among men in Ireland and are underpinned by men’s poorer lifestyle behaviours and underutilization of health services.
• A comprehensive National Men’s Health Policy was launched to integrate gender-specific approaches into health policies, programmes and services, and meaningfully translate them into practice.
• Building capacity among front-line service providers was a key policy direction to address the deficit in gender sensitive service provision for men.
• Promoting positive gender roles and supportive environments work better in engaging men in self-care than reinforcing negative gender stereotypes.
• Investment in individual learning has led to organizational and culture change through evidence-informed tools to engage with men, a network of supportive peers, continual support and a platform to spread this learning within organizations.
• Success factors have included (i) a clear mandate matched with funding and resources; (ii) comprehensive evaluation ensuring evidence of impact; (iii) adaptation and refinement in response to emerging needs; and (iv) an explicit focus on peer support and mentoring.
Building capacity among front-line health workers to engage men

In response to these issues, Ireland launched its National Men’s Health Policy in 2009 (Department of Health and Children, 2009), which is underpinned by an explicit focus on gender-specific strategies and strengths-based approaches to community engagement and capacity-building measures to reach men. Much of the work has revolved around excellent partnerships between the statutory, community/voluntary and academic sectors, resulting in the creation of a strong evidence base. This has greatly strengthened the capacity of health policy to reach so-called hard-to-reach groups of men through community outreach approaches.

This strategy has been unique in the WHO European Region and has influenced the development of the WHO regional strategy on the health and well-being of men, which is due for publication in autumn 2018. Historically, most gender-focused health policy initiatives and gender-mainstreaming approaches to health have been synonymous with women’s health. Despite a substantial body of evidence supporting the need for gender-specific approaches to reaching men with health programmes and services, often, these are not integrated in policies or fail to find any meaningful translation in practice.

Capacity building at individual, partnership and community levels is a critical component of both the process and outcome of positive engagement with men. Specifically, the need to build capacity among front-line service providers has been identified as an essential but neglected component of developing effective strategies for reaching men. ENGAGE, Ireland’s National Men’s Health Training programme, was developed to address this deficit in gender sensitive service provision for men. This comprehensive one-day training aims to increase participants’ understanding of best practice in engaging men with health programmes and services and was developed against a backdrop of: (i) poorer health outcomes and health behaviours among men; (ii) men’s underutilization of certain health programmes and services; (iii) challenges from service providers’ perspectives in engaging men; and (iv) increasing evidence in support of more gender-sensitive or so-called men-friendly approaches. In the review of the National Men’s Health Policy, ENGAGE emerged as a key pillar of policy implementation and was described as a “major and unique training resource with the capacity to reach significant numbers of front-line service providers” (Baker., 2015).

A training of trainers (ToT) cascade model of delivery was adopted as the most effective and cost-efficient way of maximizing the diffusion of ENGAGE training to front-line service providers both in terms of number and geographical spread. To date, four ToT programmes have been delivered, and the programme has been the focus of both outcome (Osborne et al., 2016) and process (Lefkowich et al., 2016) evaluations. Candidates selected for the ToT programme (trainers) were required to have prior facilitation experience, represented a national geographical spread and included a mix of professions (primary care, health promotion, and community and voluntary
ENGAGE is now firmly established as a core and evidence-based component of the Health Service Executive’s suite of training courses in Ireland, and is recognized as having a key role in improving gender equality by transforming structures and policies that engage men in self-care. ENGAGE trainers remain active and delivered training to approximately 400 participants in 2017.

Outcome evaluation findings suggest that ENGAGE succeeded in improving service providers’ capacity to engage and work with men and to deliver more gender-competent health services and programmes. Significant improvements were reported in terms of service providers’ (n=295) knowledge, skill and capacity to identify priorities for men’s health that could meet the needs of their organization, and to engage men in their services, and these were sustained up to five months post training. The vast majority of service providers (93.4%) reported that ENGAGE had impacted their work practice up to five months post training, with 39.3% having formally committed to men’s health in their workplans and/or conducting men’s health initiatives within their services (Osborne et al., 2016).

More broadly, the success of ENGAGE can be measured by the exponential rise in community outreach programmes to priority groups of men in Ireland. For example, ENGAGE was delivered to key stakeholders involved in (i) “Men on the Move” (a community-based physical activity programme targeting overweight men), which has resulted in significant and sustained weight reduction, improved fitness and reduced cardiovascular disease risk among men (Carroll et al., 2018); (ii) “Farmers Have Hearts” (an outreach cardiovascular disease prevention programme), which found a high prevalence of multiple risk factors for cardiovascular disease among farmers (van Doorn et al., 2017) and has prompted a comprehensive follow-up intervention; and (iii) “Sheds for Life” (a health promotion programme delivered in Men’s Sheds), which builds on the inherent health-promoting nature of Sheds (Lefkowich & Richardson, 2016). These examples demonstrate that ENGAGE has been effective in influencing the development of gender sensitive service provision and has significant implications for practice elsewhere.
### Lessons learned

- **Noncommunicable diseases remain the leading cause of death and disability among men in Ireland** and are underpinned by men's poorer lifestyle behaviours and underutilization of health services. Much of this is avoidable through more effective policies.

- **A comprehensive approach has been essential.** The National Men’s Health Policy was launched to integrate gender-specific approaches to health programmes and services and meaningfully translate them into practice.

- **Building capacity among front-line service providers through ENGAGE, Ireland’s National Men’s Health Training programme, was a key activity** within this comprehensive health strategy to address the deficit in gender sensitive service provision for men.

- **Positive gender roles and supportive environments work better than reinforcing negative gender stereotypes.** ENGAGE has evolved from simply informing gender sensitive service provision for men to a more gender transformative role in contributing to gender equality, by challenging harmful gender roles and norms and developing supportive environments to engage men in self-care.

- **Investment in individual learning has led to organizational and culture change.** Giving front-line service providers evidence-informed tools to engage with men, a network of supportive peers, continual support and a platform to spread this learning within organizations can have a transformative impact on the norms of organizational practice related to men’s health.

- **Success factors** instrumental in sustaining and maintaining momentum were: (i) continuing to have a men's health policy mandate, which has been significant in securing the requisite funding and resources; (ii) conducting a comprehensive evaluation, thus ensuring that the programme is evidence based; (iii) adapting and refining the programme in response to emerging needs; and (iv) having an explicit focus on peer support and mentoring.
