Nutrition, Physical Activity and Obesity
Lithuania

Monitoring and surveillance
Overweight and obesity in three age groups

**Adults (20 years and over)**

Intercountry comparable overweight and obesity estimates from 2008 (1) show that 60.7% of the adult population (≥20 years old) in Lithuania were overweight and 27.6% were obese. The prevalence of overweight was higher among men (64.0%) than women (57.9%). The proportion of men and women that were obese was 24.8% and 29.9%, respectively.

According to the FINBALT 2010 survey (nationally representative population aged 15–64 years), 56.3% were overweight and 22.2% were obese. Overweight

---

Notes. The country codes refer to the ISO 3166-1 Alpha-3 country codes. Data ranking for obesity is intentionally the same as for the overweight data. BMI: body mass index. Source: WHO Global Health Observatory Data Repository (1).
prevalence estimates were 62.1% for men and 52.7% for women. The prevalence of obesity for men and women was 20.3% and 22.2%, respectively. (2). It should be taken into account that these data do not allow for comparability across countries.

Adulthood obesity prevalence forecasts (2010–2030) predict that in 2020, 12% of men and 14% of women will be obese. By 2030, the model predicts that 10% of men and 10% of women will be obese.¹

**Adolescents (10–19 years)**

In terms of prevalence of overweight and obesity in adolescents, up to 27% of boys and 13% of girls among 11-year-olds were overweight, according to data from the Health Behaviour in School-aged Children (HBSC) survey (2009/2010).²

Among 13-year-olds, the corresponding figures were 18% for boys and 11% for girls, and among 15-year-olds, 15% and 5%, respectively (3).

**Children (0–9 years)**

Estimates from the first round (2007/2008) of the WHO European Childhood Obesity Surveillance Initiative (COSI) show that among 7-year-olds in Lithuania, 24.8% of boys and 21.0% of girls were overweight and 9.4% and 7.2%, respectively, were obese (4).

**Exclusive breastfeeding until 6 months of age**

Nationally representative data from 2010 show that the prevalence of exclusive breastfeeding at 6 months of age was 27.4% in Lithuania.³

**Saturated fat intake**

According to the 2007 estimates of the Food and Agriculture Organization of the United Nations (FAO), the adult population in Lithuania consumed 8.2% of their total calorie intake from saturated fatty acids (5). According to national data from 2007, the adult population aged 19–64 years in Lithuania consumed 13.2% of their total calorie intake from saturated fatty acids (13.5% for men and 12.9% for women) (6). It should be taken into account that these latter, national data do not allow for comparability across countries due to sampling and other methodological differences.

Fruit and vegetable supply
Lithuania had a fruit and vegetable supply of 471 grams per capita per day, according to 2009 estimates (5).

Salt intake
Data from 2007 show that salt intake in Lithuania was 10.9 grams per day for men and 7.1 grams per day for women (7).

Iodine status
According to the most recent estimates on iodine status, published in 2012, the proportion of the population with an iodine level lower than 100 µg/L was 59.7% (8, 9).

Physical inactivity
In Lithuania, 23.0% of the population aged 15 years and over were insufficiently active (men 20.9% and women 24.8%), according to estimates generated for 2008 by WHO (1). A national survey conducted in 2011 by the Department of Physical Education and Sports within the Government of Lithuania reported that about 20% of the population aged 7–80 years were engaged in organized physical activity (PA) (in clubs, schools, universities, sports centres, and so on) (10). The FINBALT 2010 survey reported that the proportion of adults aged 20–65 years partaking in leisure time physical exercise for at least 30 minutes on four days or more per week was 10.1% (2). In addition, the proportion of individuals walking or cycling to and from work for at least 15 minutes was 37%. It should be taken into account that data from the two last mentioned surveys do not allow for comparability across countries due to sampling and methodological differences.

Policies and actions
The table below displays (a) monitoring and evaluation methods of salt intake in Lithuania; (b) the stakeholder approach toward salt reduction; and (c) the population approach in terms of labelling and consumer awareness initiatives (7).

Marketing of food and non-alcoholic beverages to children (12)

A draft law on advertising is being processed which prohibits advertisements for confectionery, soft drinks and snacks on TV and radio programmes, as well as in press publications intended for children. A procedure for the provision of healthy nutrition in primary and secondary schools was adopted in 2010 through Ministerial Order V-645 (13). It restricts the supply of food and products high in fat, sugar and salt (HFSS) in school meals. A “Procedure for approval of the catering in preschool education, general education schools and children’s social care institutions” – adopted in 2011 through Ministerial Order V-964 – restricts the supply of HFSS food and products to all children’s establishments (14). Article 17 prohibits the provision of food that contains more than 0.4 grams of sodium per 100 grams.
