Monitoring and surveillance
Overweight and obesity in three age groups

Adults (20 years and over)
Intercountry comparable overweight and obesity estimates from 2008 (1) show that 61.9% of the adult population (≥ 20 years old) in Ireland were overweight and 25.2% were obese. The prevalence of overweight was higher among men (67.8%) than women (56.0%). The proportion of men and women that were obese was 26.2% and 24.2%, respectively. Adulthood obesity prevalence forecasts (2010–2030) predict that in 2020, 40% of men and 37% of women will be obese. By 2030, the model predicts that 47% of both men and women will be obese.1

1 Report on modelling adulthood obesity across the WHO European Region, prepared by consultants (led by T. Marsh and colleagues) for the WHO Regional Office for Europe in 2013.

The Regional Office is grateful to the European Commission (EC) for its financial support for the preparation of this country profile and the development of the nutrition, obesity and physical activity database that provided data for it.
Adolescents (10–19 years)
In terms of prevalence of overweight and obesity in adolescents, up to 37% of boys and 23% of girls among 11-year-olds were overweight, according to data from the Health Behaviour in School-aged Children (HBSC) survey (2009/2010). Among 13-year-olds, the corresponding figures were 20% for boys and 11% for girls, and among 15-year-olds, 19% and 14%, respectively.

Children (0–9 years)
Estimates from the first round (2007/2008) of the WHO European Childhood Obesity Surveillance Initiative (COSI) show that among 7-year-olds in Ireland, 31.8% of boys and 27.3% of girls were overweight and 11.6% and 7.7%, respectively, were obese.

Exclusive breastfeeding until 6 months of age
Nationally representative data from 2008 show that the prevalence of exclusive breastfeeding at 6 months of age was 2.5% in Ireland.

Saturated fat intake
According to 2007 estimates, the adult population in Ireland consumed 11.5% of their total calorie intake from saturated fatty acids.
Fruit and vegetable supply

Ireland had a fruit and vegetable supply of 669 grams per capita per day, according to 2009 estimates (4).

---

Salt intake

Data from 2007 show that salt intake in Ireland was 10.3 grams per day for men and 7.4 grams per day for women (5).

---

Iodine status

According to the most recent estimates on iodine status, published in 2012, the proportion of the population with an iodine level lower than 100 µg/L was 56.2% (6, 7).

---

Physical inactivity

In Ireland, 46.6% of the population aged 15 years and over were insufficiently active (men 43.6% and women 49.4%), according to estimates generated for 2008 by WHO (1).

---

Policies and actions

The table below displays (a) monitoring and evaluation methods of salt intake in Ireland; (b) the stakeholder approach toward salt reduction; and (c) the population approach in terms of labelling and consumer awareness initiatives (5).

---

### Salt reduction initiatives

### Marketing of food and non-alcoholic beverages to children (9)

The 2005 Children's Advertising Code (10) contains statutory controls to regulate some aspects of TV advertising of unhealthy food to children. In June 2009 the new Broadcasting Act (11) contained provisions for the new Broadcasting Authority (12) to introduce regulations to protect children from advertising of foods high in fat, sugar or salt through the broadcast media. The Broadcasting Authority has reviewed the Children's Commercial Communications Code (13), which is a statutory instrument.

### Physical activity (PA), national policy documents and action plans
