Monitoring and surveillance
Overweight and obesity in three age groups

**Adults (20 years and over)**

Intercountry comparable overweight and obesity estimates from 2008 (1) show that 64.2% of the adult population (≥ 20 years old) in the United Kingdom of Great Britain and Northern Ireland were overweight and 26.9% were obese. The prevalence of overweight was higher among men (67.7%) than women (60.8%). The proportion of men and women that were obese was 26.0% and 27.7%, respectively. Adulthood obesity prevalence forecasts (2010–2030) predict that in 2020, 31% of men and 30% of women will be obese. By 2030, the model predicts that 36% of men and 33% of women will be obese.1

---

Notes. The country codes refer to the ISO 3166-1 Alpha-3 country codes. Data ranking for obesity is intentionally the same as for the overweight data. BMI: body mass index.

1 Report on modelling adulthood obesity across the WHO European Region, prepared by consultants (led by T. Marsh and colleagues) for the WHO Regional Office for Europe in 2013.

The Regional Office is grateful to the European Commission (EC) for its financial support for the preparation of this country profile and the development of the nutrition, obesity and physical activity database that provided data for it.
Adolescents (10–19 years)
In terms of prevalence of overweight and obesity in adolescents, up to 18% of boys and 17% of girls among 11-year-olds were overweight in England, according to data from the Health Behaviour in School-aged Children (HBSC) survey (2009/2010). Among 13-year-olds, the corresponding figures were 11% for boys and 17% for girls, and among 15-year-olds, 14% and 12%, respectively. In Scotland, up to 23% of boys and 20% of girls among 11-year-olds were overweight. Among 13-year-olds, the corresponding figures were 20% for boys and 10% for girls, and among 15-year-olds, 18% and 13%, respectively. In Wales, up to 30% of boys and 21% of girls among 11-year-olds were overweight. Among 13-year-olds and among 15-year-olds, the corresponding figures were the same; 26% of boys and 17% of girls were overweight in each age group.

According to measured data from the 2011/2012 National Child Measurement Programme in England, the proportion of overweight schoolchildren aged 10–11 years was 35.4% in boys and 32.4% in girls; and the proportion that were obese was 20.7% and 17.7%, respectively. It should be taken into account that these figures (which are based on the British 1990 growth reference) do not allow for comparability across countries.

Children (0–9 years)
No prevalence figures are available for overweight and obesity in schoolchildren based on measured intercountry comparable data. The United Kingdom of Great Britain and Northern Ireland is not yet participating in the WHO European Childhood Obesity Surveillance Initiative (COSI).

However, data on overweight and obesity in children aged 4–5 years are available from the 2011/2012 National Child Measurement Programme in England. The overweight and obesity figures were 23.5% (boys) and 21.6% (girls) for overweight and 9.9% and 9.0% for obesity, respectively. It should be taken into account that these figures (which are based on the British 1990 growth reference) do not allow for comparability across countries.

Exclusive breastfeeding until 6 months of age
Nationally representative data from 2010 show that the prevalence of exclusive breastfeeding at 6 months of age was 1.0% in the United Kingdom of Great Britain and Northern Ireland.

Notes. The country codes refer to the ISO 3166-1 Alpha-3 country codes. Data were derived from country-specific publications on surveys carried out in this field, not as part of a European-wide survey. Due to different data collection methods of the country-specific surveys, any comparisons between countries must be made with caution.

Salt intake
Data from 2011 show that salt intake in the United Kingdom of Great Britain and Northern Ireland was 8.1 grams per day for both men and women (7).
Iodine status
No data are available.

Physical inactivity
In the United Kingdom of Great Britain and Northern Ireland, 66.5% of the population aged 15 years and over were insufficiently active (men 61.1% and women 71.6%), according to estimates generated for 2008 by WHO (1). Data from 2012 show that 39% of the adult population (≥ 19 years old) in England (United Kingdom) did not meet the 2012 British guideline for physical activity (men 34% and women 44%) (8). It should be taken into account that these latter, national data do not allow for comparability across countries due to sampling and other methodological differences.

Policies and actions
The table below displays (a) monitoring and evaluation methods of salt intake in the United Kingdom of Great Britain and Northern Ireland; (b) the stakeholder approach toward salt reduction; and (c) the population approach in terms of labelling and consumer awareness initiatives (7).

Marketing of food and non-alcoholic beverages to children (10)
Statutory rules apply to advertisements for foods high in fat, sugar or salt on TV channels dedicated to children, in or around programmes aimed at children (including preschool children), or in or around programmes that are likely to be of particular appeal to children aged 4–15 years (11). The definition of “particular appeal” is that the programme attracts children in excess of their proportion within the population (by 20% or more).

The United Kingdom of Great Britain and Northern Ireland is a major provider of satellite channel TV content throughout much of the European Region. Under the cross-border rules of the European Union (EU) (12), the regulations in force in the United Kingdom apply to channels transmitting from the United Kingdom to other jurisdictions.

In March 2011, the Advertising Standards Authority (ASA)’s remit was extended to cover marketing claims on marketers’ own websites and in other space that they control (even space that is not paid for) (13). The Code of Advertising Practice (CAP) extension covers, for instance:

... Advertisements and other marketing communications by or from companies, organizations or sole traders on their own websites, or in other non-paid-for space online under their control, that are directly connected with the supply or transfer of goods, services, opportunities and gifts, or which consist of direct solicitations of donations as part of their own fund-raising activities.

Previously, ASAs remit online was limited to advertisements that are paid for (such as pop-ups and banner advertisements) and sales promotions, wherever they appeared.

In practice, this means that the provisions of the CAP now apply to advertisers’ own websites and advertising on social media sites. These provisions prevent: marketing to children that uses promotional offers, licensed characters or celebrities in food advertisements, other than for fruit and vegetables; food advertisements that condone or encourage poor nutritional habits or dietary practice; and food advertisements that encourage “pester power” or use “hard sell” or other high-pressure techniques.
Physical activity (PA), national policy documents and action plans
